How To Scan QR Code and Store in an Excel File

Open the script and pass the Excel sheet name where you want to store the data as below,

```
# Release the camera and close OpenCV windows
cap.release()
cv2.destroyAllWindows()

cameraIdx = 0
exelFileName = "DispatchedDeviceList.xlsx"
excelData = readExcel(exelFileName)
rowNum = findFilledRowNumber(excelData)
print("rowNum:", rowNum)
scanQRAndStoreDevIdInExcel(rowNum, cameraIdx)
```

If the given name file does not exist then it will create a new file else it will append the data to the existing sheet.

#Note:

1. Pass camera index 0 for external camera.
2. Press q for stop/end camera frame
